## Summary

In 2018 we stayed from April 26<sup>th</sup> to June 4<sup>th</sup> on the Peloponnese. Our aim was to study and collect plants in undercollected areas of lower and hillside regions of Korinthia, Argolis, Arkadia and Lakonia. Because of the weather conditions we had to change our plans slightly. The reason was, that there was no rain in the north-eastern part of Peloponnese from January to April. The lower regions – up to 800 m – were rather dry and showed the aspect of late summer or early autumn. Mainly the early flowering annuals had disappeared. From 900 m upwards the flora was in normal condition. Altogether we collected 9.162 and observed 891 species. All specimen are mounted and labelled and will be delivered to Botanical Museum Berlin-Dahlem in February 2019. We tried to take pictures of the most interesting species. These pictures will be given to the Botanical Institute of the University of Patras and as far as possible and wanted used for the Flora of Greece. All collection data will be imported into the data-base of the Flora of Greece.

## Einführung

Die Peloponnes erschien uns immer als ein recht gut untersuchtes Gebiet. Bei genauerem Hinschauen stellten wir aber fest, dass sich die wesentlichen Untersuchungen auf die hohen Lagen des Chelmos, des Kyllini, des Mainalon, des Parnon und des Taygetos bezogen. Das Hügelland dazwischen wurde offensichtlich weniger besucht und besammelt, wohl eher auf der Durchreise. Teile dieser überwiegend niederen und mittleren Lagen haben wir uns für 2018 vorgenommen.

Unglücklicherweise stellte es sich heraus, dass es auf der Peloponnes in den Monaten Februar bis April fast gar nicht geregnet hatte. Der Winter davor brachte nach Aussagen von Einheimischen auch in den Höhen der Gebirge kaum Schnee. Dementsprechend trocken und fortgeschritten zeigte sich die Pflanzenwelt. Die niederen und mittleren Lagen zeigten eher einen spätsommerlichen bis frühherbstlichen Aspekt. Früher blühende Arten waren total vertrocknet oder zeigten nur Früchte; stattdessen sahen wir manche Art, die wir eher im August und September erwartet hätten. In Höhenlagen oberhalb von 900 m zeigten sich die Pflanzen im eher normalen Aspekt, das heißt spätblühende Arten waren überwiegend noch in Knospe.

Wir begannen die Reise am 26. April 2016 in Patras bzw. in Xylokastro. Die erste Woche erkundeten wir von Xylokastro aus die Nordhänge des Kyllini und seiner benachbarten Berge. Am 28. April waren wir zu Gast bei einer Exkursion von Prof. Dimopoulos, Patras, Prof. Strid, Kopenhagen und Dr. Raus, Berlin, am Kyllini.

Am 3. Mai wechselten wir nach Loutro Elenis am Saronischen Golf. Von hier machten wir zwei Stippvisiten in die Gerania Ori und erkundeten die Berge zwischen Korinth und Epidavros. Die Küstenhänge zwischen Loutro Elenis über Epidavros nach Kalloni, ebenso wie die Halbinsel Methana und die Bermassive Aderes und Didymo zwischen Methana und Kranidi zeigten aufgrund des Wassermangels einen beinahe herbstliches Bild. Dies galt auch für die Ebene um Navplio und Argos und die niederen Lagen entlang der Küste bis Astros.

Das änderte sich erst bei unseren Fahrten von Argos ins Artemiso-Massiv und von Astros in die Berge von Arkadien, auch wenn hier fast alle frühjahrsblühenden Arten verblüht und vertrocknet waren. Sehr viel erfreulicher waren die Berge im Nord-Parnon, die wir von Karyes aus erkundeten, und die Ost-Hänge des Taygetos oberhalb von Xirokampi.

In beiden Gebieten sind die Straßen mittlerweile in einem sehr guten Zustand; es sind viel mehr Straßen asphaltiert, als auch die neueren Karten angeben. An vielen Tagen haben wir uns gefragt, für wen die Straßen asphaltiert worden sind, so wenig waren die Straßen befahren.

Wie im vergangenen Jahr haben wir noch konsequenter Pflanzen fotografiert. Nur wenige Male haben wir besondere Arten nicht erkannt, so dass keine Fotos vorliegen. Für alle fotografierten Arten

gibt es vom Fundort Herbarbelege. Ausgewählte Bilder sind auf der Homepage [www.willing-botanik.de](http://www.willing-botanik.de) einzusehen. Das gesamte Bildmaterial wird später in das Virtuelle Herbar Jacq eingefügt werden. Alle Sammeldaten und Bilder werden dem Botanischen Institut der Universität Patras für die Flora of Greece zur Verfügung gestellt. Bei Bedarf, vor allem für wissenschaftliche Zwecke, sind wir natürlich bereit Originalbilder im jpg-Format oder komprimiert für Dokumente abzugeben.

Insgesamt haben wir etwa 9.162 Pflanzen an 422 Fundstellen gesammelt und etwa 891 eindeutig zuzuordnende Arten notiert. Zusätzlich haben wir etwa 1200 Arten im Gelände fotografiert.

Wir erwarten von dieser Reise keine spektakulären Neufunde, aber eine gewisse Erweiterung des Wissens über die Verbreitung vieler Arten auf der Peloponnes. Einige schöne Funde sollen hier kurz im Bild vorgestellt werden:

*Astragalus drupaceus* (Titelbild) von einem bisher unbekanntem Fundort bei Zemenos:  
Korinthia, SSW Zemenos, 38°01'01"N, 22°36'00"E, 26.04.2018

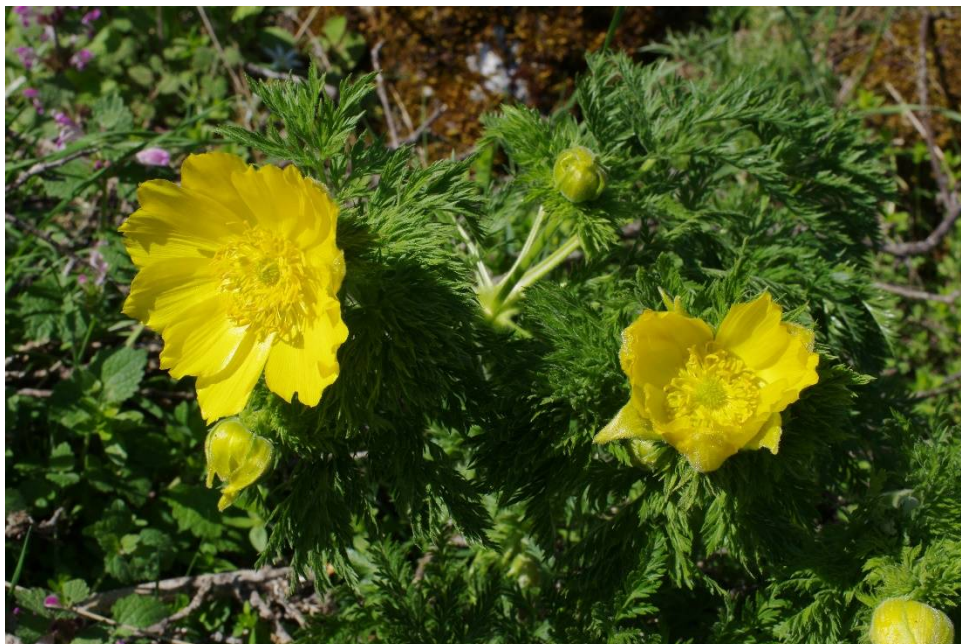

*Astragalus hellenicus*: Korinthia, S Evrostina, 38°02'10"N, 22°23'55"E, 02.05.2018

*Polygala rausiana*: Korinthia, SW Zemenos, 38°00'47"N, 22°34'02"E, 01.05.2018

*Hymenonema laconicum*: Lakonia, WSW Paleopanajia, 36°58'29"N, 22°25'32"E, 01.06.2018

*Adonis cyllenea*: Korinthia, Ano Trikala, 37°59'01"N, 22°26'18"E, 28.04.2018

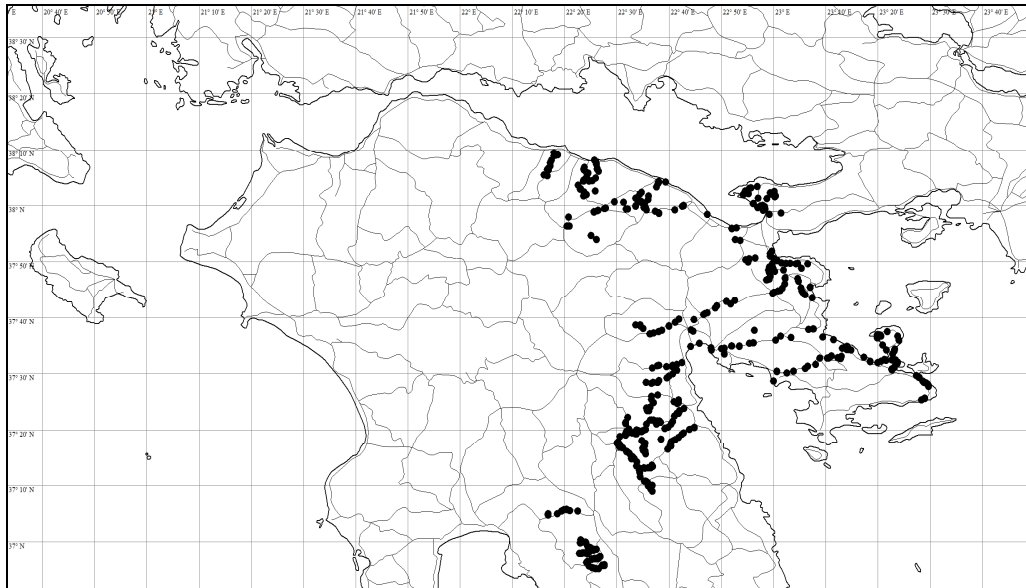

*Plantago lagopus*: Argolis, NO Neo Ireo, 37°40'26"N, 22°46'39"E, 16.05.2018

*Linum decumbens*: Korinthia, S Xylokastro, 38°03'18"N, 22°37'39"E, 26.04.2018

Unsere Reiseroute und die bearbeiteten Fundstellen zeigt folgende Figur:

In "Vascular Plants of Greece. An annotated checklist, Englera 31, Berlin November 2013 steht im Kapitel Acknowledgements geschrieben: "The main contributors to the database in terms of registered records are Arne Strid with 312 544 records and Britt Snogerup with 139 424". 2 Absätze weiter heißt es: "The vast and excellent collection by Eckhard Willing (B), the largest of any individual contributor, have been a major data source". Tatsache ist, dass Herrn A.Strid in Frühjahr 2012 die Daten von 218 299 Belegen aus dem Herbarium Willing vorlagen. Ein Widerspruch ist unübersehbar und lässt nur den Schluss zu, dass die Belege aus dem Herbarium Willing in den 312 544 Belegen von A. Strid "versteckt" sind. Eine Aufklärung und Korrektur durch den Autor wäre wünschenswert.

## 2. Fundorte

Die Geodaten sind mit einem GPS 72 von Garmin ermittelt worden. Die Schreibweise der UTM-Daten hat sich bei unserer botanischen Feldarbeit seit über 30 Jahren bewährt. Sie erleichtert durch die klare Ausweisung von 10 x 10 km- bzw. 5 x 5 km-Quadranten die Sammelplanung und das Sammeln im Gelände. Die Fundortkürzel, zum Beispiel Kor 197, dienen nur der internen Organisation, zum Beispiel der Verknüpfung von Arten-Tabellen und Fundort-Tabellen in unserer Access-Datenbank.

### **3. Arten**

Die Nomenklatur folgt ausschließlich den Vascular Plants of Greece (VPoG), Berlin 2013. Abweichungen sind ungewollt. Für die Bestimmung wurde auch der Atlas of the Aegean Flora, von A.Strid herangezogen. Für uns Hobby-Floristen ist es absolutlich unerklärlich, warum dieses Werk, dessen Autor Mitautor der VPoG ist, in derart vielen Fällen vom Konzept der VPoG abweicht, und bei zahlreichen Arten den Leser hinsichtlich der Abgrenzung von Unterarten im Ungewissen lässt.

#### **Abies cephalonica**

291215, Ark 641, W Mega Tourla

#### **Acacia cyanophylla**

### **Hedypnois rhagadioloides subsp. rhagadioloides**

Aufgrund meiner eigenen Beobachtungen erscheint mir eine Unterscheidung in die beiden Unterarten problematisch. Die Übergänge von schlanken zu verdickten Fruchtstängeln erscheinen mir eher zufällig und sind in einzelnen Populationen nebeneinander zu beobachten.
